

Day 16

Project Planning, Setup & Environment Configuration

Tasks Completed

1. **Defined the project scope and objectives:**

- The goal was to create an AI-powered interview simulator that asks role-based questions, evaluates answers, and provides structured feedback.
- Identified features such as difficulty levels, scoring, evaluation prompts, and interview summary.

2. **Researched API and Prompt Engineering requirements:**

- Understood how Gemini's `generate_content()` works.
- Explored structured prompting for consistent outputs.

3. **Environment Setup:**

- Installed necessary Python libraries:
streamlit, dotenv, google-generativeai.
- Created `.env` file to securely store API keys.
- Set up project directories:
- `/project`
- `├── app.py`
- `├── .env`
- `└── requirements.txt`

4. **API Configuration:**

- Verified API key loading with `dotenv`.
- Tested Gemini connection with a basic text generation script.

Outcome

The foundation of the project was set up. All required tools were connected, the environment was working, and the Gemini API was ready for integration.
