

Day 17

Prompt Engineering & Backend Logic Development

Tasks Completed

1. Created the System Prompt:

- Defined the AI's behavior as a *professional interviewer*.
- Set rules: Ask one question at a time, evaluate objectively, score responses, maintain HR tone.
- This system prompt ensures consistent behavior across all interactions.

2. Developed Functional User Prompts:

- Designed prompt templates for:
 - **Question Generation:** Based on role + difficulty + question number.
 - **Answer Evaluation:** Structured into Strengths, Weaknesses, and Score.

3. Backend Helper Functions:

- `generate_question()`: Sends combined system + user prompt to generate one question.
- `evaluate_answer()`: Sends prompt containing user answer and requests structured evaluation.

4. Refined Prompts Through Testing:

- Adjusted wording to ensure the model returns *only questions* (not explanations).
- Ensured scoring appears strictly as "Score (1-10):".

Outcome

The entire logical backbone of the app was created. Prompt engineering ensured stable, predictable outputs and improved the reliability of the interview simulation.
